

## Theoretical Q-values in Pendulum (All negative, but vary widely)

## Why Clipping Hurts: Loss of Granularity

### WITHOUT Clipping

Near terminal ( $Q \approx 0$  step)  $\rightarrow$  target  $\approx -16.1$    Near terminal ( $Q \approx 0$  step)  $\rightarrow 0$   $\rightarrow$  target  $\approx -16.2$

Medium distance ( $Q \approx -150$  steps)  $\rightarrow$  target  $\approx -155$    Medium distance ( $Q \approx -150$  steps)  $\rightarrow$  target  $\approx -66$

Far from terminal ( $Q \approx -500$  steps)  $\rightarrow$  target  $\approx -640$    Far from terminal ( $Q \approx -500$  steps)  $\rightarrow$  target  $\approx -640$

- ✓ Relative ordering preserved
- ✓ Fine distinctions learned

- ✗ Clipping biases near-terminal states
- ✗ Can't distinguish 1 vs 2 steps
